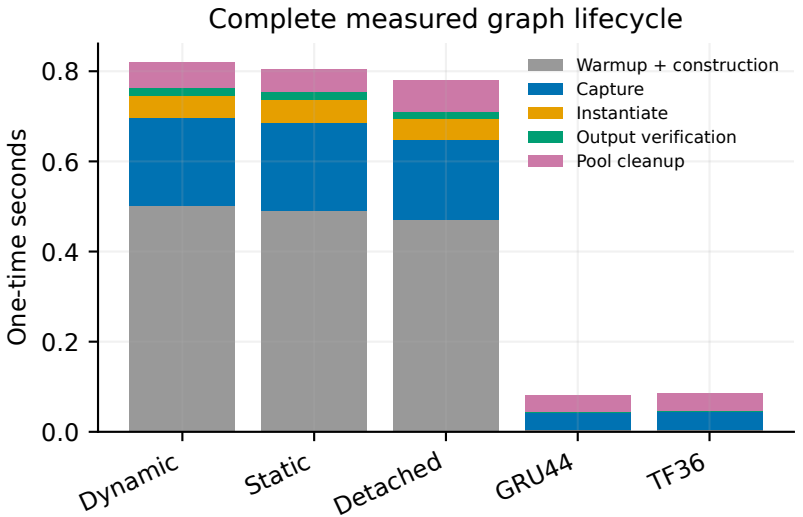
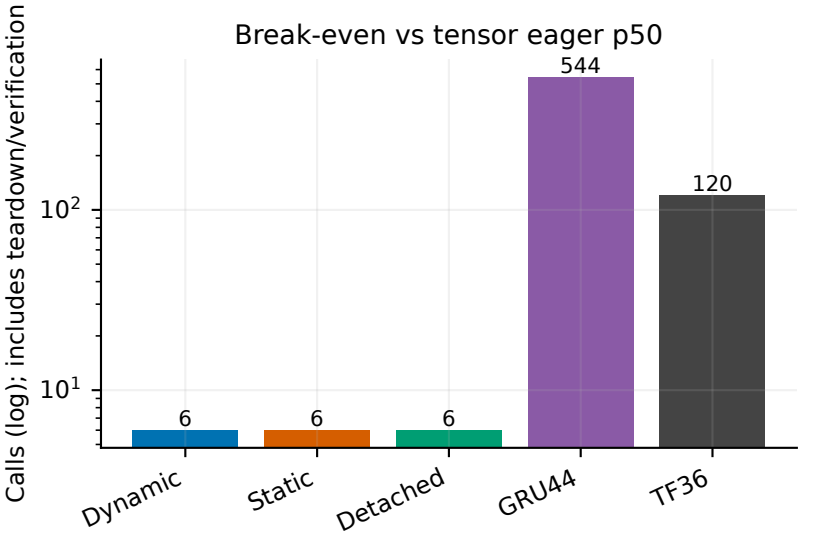
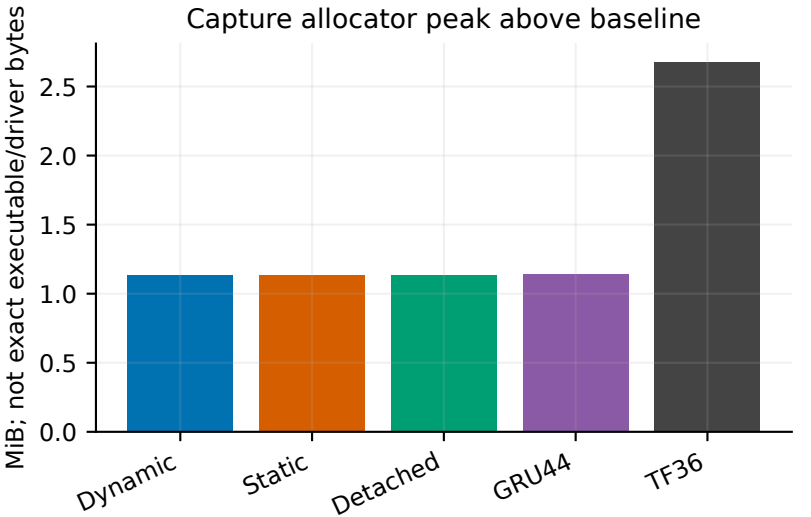
Paid CUDA Graph lifecycle | B1, L256, soft, frozen LM weights







Complete lifecycle=side-stream warmup+construction+capture+instantiation+first-output verification+postdraw verification+pool cleanup. Break-even uses complete lifecycle/(tensor-eager p50 - graph p50); undefined if no saving. Shared input/load checks are charged separately in original audit. Private pool per shape/case; no free persistent multi-shape cache or FLOP reduction is claimed.
